

Project Follow up – 01

Project Title :

ReliefX: Smart Flood Relief Management System

Course Title : Database Management System Lab

Course Code : CSE312

Section : 67_F1

Team Name : **StratifyX**

Team Members

- Gulam Sakaria (242-15-218)
- MD. Ashraful Islam (242-15-487)
- Mir Samiul Haque (242-15-350)
- Nafil Ardul Ridin (242-15-705)
- Zidne Hasan (242-15-356)

Project Overview

Bangladesh is one of the most flood-prone countries in the world. Every year, floods affect thousands of people, causing damage to homes, food supplies, and essential resources. During these emergencies, government organizations, NGOs, volunteers, and local authorities work together to provide relief support. However, many relief operations are still managed manually, which often leads to several challenges.

Some families may receive relief more than once while others may not receive any. It is also difficult to keep accurate records of beneficiaries, monitor available relief items, manage volunteers, and track distribution activities. These issues reduce the efficiency and transparency of the overall relief process.

To address these challenges, our team is planning to develop **ReliefX: Smart Flood Relief Management System**. The system will provide a centralized database where all information related to flood relief operations can be managed efficiently. It will help organize beneficiary records, NGO information, volunteer activities, relief inventory, and distribution history in a structured and secure manner.

Our objective is to demonstrate how a well-designed database management system can improve data organization, reduce manual errors, and support better decision-making during flood relief operations.

Proposed Modules

The proposed system may include the following modules:

- User Authentication
- Victim & Family Registration
- NGO Management
- Volunteer Management
- Relief Item & Inventory Management
- Relief Distribution Management
- Distribution History
- Reports & Basic Analytics

These modules are currently under discussion and may be updated based on instructor feedback.

Technology Stack

Frontend

- HTML
- CSS
- Bootstrap

Backend

- PHP

Database

- MySQL

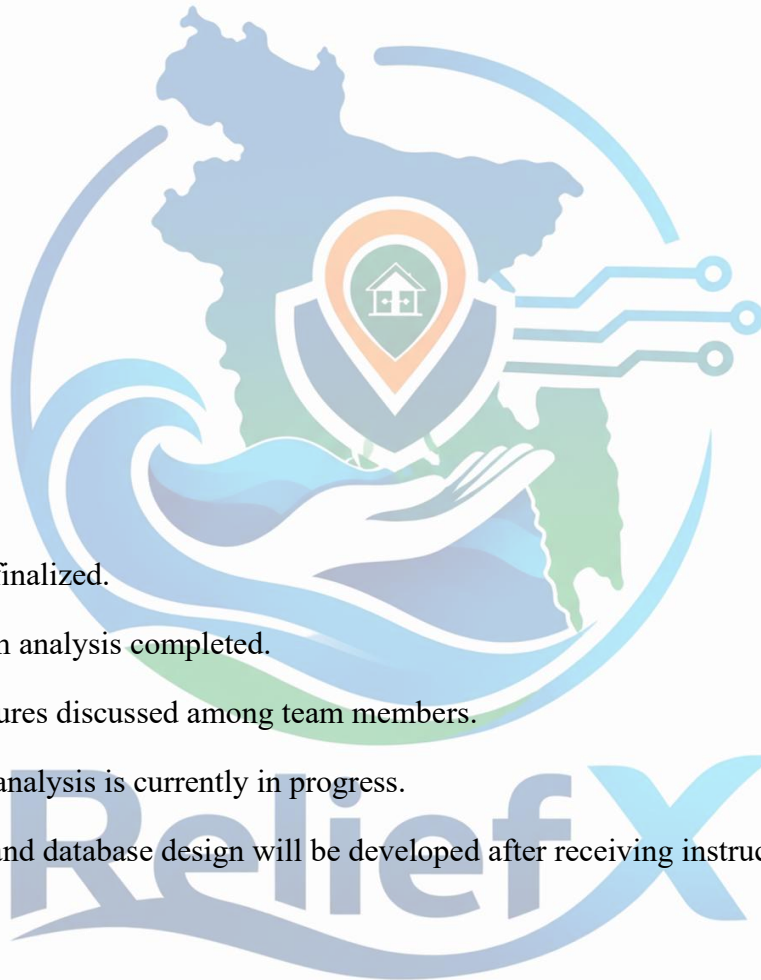

Current Progress

- Project topic finalized.
- Initial problem analysis completed.
- Proposed features discussed among team members.
- Requirement analysis is currently in progress.
- ER Diagram and database design will be developed after receiving instructor feedback.

Feedback Required

We would appreciate your valuable suggestions regarding:

- Whether the project scope is appropriate.
- Whether the proposed modules are sufficient.
- Any recommendations before we begin the ER Diagram and database design.

Conclusion

This document presents our initial project proposal and overall idea. Based on your valuable feedback and suggestions, we will finalize the system requirements and proceed with the database design, implementation, and further development in the next phase.
